

Hello and thank you for purchasing the 1x8NPNBuddy!

This was originally designed as a eurorack conversion for the Lyra-8 by SOMA labs, but can certainly be used for other projects that have a 1x8 contact matrix. The added benefit of this module is that it is entirely passive and comes in 2 forms of connection. The main form is using a 10-pin ribbon cable with auxiliary board, and the other is using alligator clips straight to the pads via m3 screws.

**The target audience of this module, at the time of writing(11JAN2023), are the DIY L8 builders who wouldn't mind changing out the flat top contacts for something else. Please see the 'M3 explanation' document for further information.**

We are not affiliated with SOMA, I just made this because I wanted to. Also artists should sell more of their tools on their record labels. OSC/Pilot and Autechre's MAX patches are something we should see more of.

Cheers,  
Oleg
